Abstract (en)
[origin: DE19749657A1] The controls (3 to 9 and 17) in a control screen (1) are provided for the input of individual functions of an individual operating program flow, said functions being filed in a memory. The operating program flow can be initiated under a name and can run according to order in a microprocessor guided manner. The controls also serve to adjust defined operating program sequences or defined parameter values of program functions and, in addition, can serve as a code for defined update functions in one or more defined sequences of function input.
