Abstract (en)

[origin: DE10003366A1] The illumination unit has a pedestal body (3) with a standing surface and a light body (9) associated with the pedestal body via a pivoting mechanism (18) and with at least one light output opening. The pedestal body and the light body at least partially engage within each other and are penetrated by the pivoting mechanism that connects them and that enables a lockable positional change between the light and pedestal bodies.
