Abstract (en)

[origin: EP1031788A2] The steam generator run-up method has the steam generator (1) and the associated water/steam circuit (25) filled with water up to the level of a steam/water separator (8), before initiating heating, with a blocking valve (7) in front of the steam turbine (6) closed and the blocking valve (10) in the bypass line leading to the separator opened. When the steam requirement for the steam turbine is reached, the first blocking valve is opened and the second blocking valve is closed. An independent claim for a water/steam circuit for run-up of a steam generator is also included.
