Abstract (en)
[origin: DE19751154A1] The paste is stored in a flexible container (4) with a central spout (6) seated in a rigid outer casing (2). As this casing is inserted into the mixer (1) a hollow needle (11) pierces the spout so that the contents are released. Water, from inlet (8), then draws in the paste, presumably by venturi action, to produce the required mixture that is drawn off at (9). As the container is withdrawn, even when the contents have only been partially used, a piston (not shown) closes the cut in the spout so that there is no material which can be touched freely.
