Abstract (en)

[origin: WO9927189A1] The invention relates to a combination of devices for inserting and pre-compressing double-ply asphalt layers. The invention is comprised of a first insertion device (E1) for inserting a supporting layer and a second insertion device (E2) for inserting a covering layer. Said devices each contain a material accommodating bucket (M1, M2), a transport system for transporting the hot mixed materials and a distribution and compression system. The invention is characterized in that both insertion devices (E1, E2) are coupled to one another, whereby the mixed materials are transported from one of the material accommodating buckets (M1), said bucket being provided for intermediate storage of the covering layer material, to the second insertion of device (E2). An additional transport system (7) leads out of a material accommodating bucket (M1) and transports the covering layer material to the material accommodating bucket of the second inserting device located directly downstream.
