Abstract (en)
[origin: WO9922888A1] A bending roller, in particular for use in the production of cones or frustoconical objects of plate material, comprises a lower roller (1) and an upper roller (2) movable in a vertical plane relatively to the lower roller. The lower roller consists of a plurality of individual rotatable circular segments (6) on a shaft (3), said segments being provided with a coating (7) of rubber or similar resilient material. When the lower roller is formed by individual segments, the lower roller may run at different speeds of rotation on the individual segments, which assists the production of cone objects.
