Abstract (en)  
[origin: WO9919463A1] The present invention is a method for diagnosing a patient at risk to thrombocytopenia induced by administration of a GP IIb/IIIa receptor antagonist, which comprises combining i) a plasma sample of the patient; ii) detectable monoclonal antibody which recognizes induced binding sites formed on the GP IIb/IIIa receptor following association of a fibrinogen receptor antagonist with the GP IIb/IIIa receptor; and iii) GP IIb/IIIa receptor: GP IIb/IIIa receptor antagonist complex, and determining association of the detectable monoclonal antibody with the complex in the presence of the plasma.
