Abstract (en)
[origin: WO9923802A1] A cellular system for handling outgoing calls from a mobile station (1) including a network element (8) being capable of recognizing voiced commands and names, and has in memory a database of telephone numbers corresponding to an array of names. The mobile station (1) connects to the network element (8) and the mobile station user communicates the desired outgoing call function to the network element (8) by voice. This desired outgoing call function may be communicated while the mobile station (1) is engaged in using supplementary services provided by the network element (8), at any operation point in those services. The network element (8) evaluates the voice communication, retrieves any corresponding information, including telephone numbers, and communicates the necessary information needed by the mobile station (1) to carry out the desired function to the mobile station (1).
