Abstract (en)

[origin: EP1035000A2] A storage device(3) line-dependently and/or geodetically records track data(S) such as straight lengths of line, curved sections with a constant radius, points and cambers. From this data, tilting signals for tilt actuating components(9) are derived in dependence of the rail vehicle's actual location recorded while running. Signals(G) of a sensor(4) adjusted for receiving global positioning system signals may serve to determine the location of the vehicle.
