Abstract (en)  
[origin: EP1035371A2] A lamp arrangement (17-29) has a lamp module (12-31) containing the light-technical components and a connecting module (1-30) which can be fixed to it, constructed as a coupling member between the lamp module and a fastening base (18-32). The lamp module can be connected with the connecting module by mechanical cooperation of first and second connecting members of a connecting system. To the connecting module is assigned the first connecting member (7-33) and to the lamp module, the second connecting member of the connecting system, forming a representative unit with the respective module. The first connecting member after a connection of the lamp module with the connecting module reaches into an undercut formed by the other connecting member so that the lamp module is fastened to the connecting module by connecting members engaging like a rivet.
