Abstract (en)
[origin: WO9930791A1] The invention relates to a device for releasing the rests which support the bars of jumps in horse-riding arenas. According to the invention, the support of the rest flaps under when a horse fails the jump, hereby releasing the rest. The rest support is released by means of a spring assembly, said spring assembly being supported in a slide which moves upwards and downwards. Initially, the jump rest support is locked in its functional position. The lock is released when the forces exerted in the event of a mis-jump exceed the prestress force of the spring assembly, hereby moving the slide downwards.
