Abstract (en)  
[origin: WO9852830A1] The present invention relates to a pallet comprising at least one upper loading deck (2) and spacers (3) joined to the loading deck (2). The loading deck (2) and each of the spacers (3) are joined together by means of a joining device comprising a female part (12), which exhibits an inner bore and a flanged portion (13) in its one end, as well as a male part (8), which exhibits a shank and a flanged portion (9) in its one end. By its shank, the male part (8) is insertable into and engageable with the bore of the female part (12) by the application of a force pressing the male part and the female part towards each other, and disengageable by the application of a force in the opposite direction. The female part (12) is inserted into a through hole in the pallet and the flanged portions (9, 13) abut against the opposite side faces of the pallet. On its outside, the female part (12) is provided with at least one longitudinal ridge (16).
