Abstract (en)

[origin: EP1036519A1] The dispenser comprises a body (2) inside which a pushbutton (15) comprising a threaded rod (16) can move. The body comprises two tubular parts (3,4) which can rotate relative to each other. The first part is closed at one end by a plug (5) with an internal annular groove (7). The second part is passed through axially by a passage (8) forming a housing for the product (P) in the shape of a short stick. The pushbutton is driven axially by a releasable drive to dispense the product (P) and is returned to its initial position by a spring (26), partially housed in the pushbutton, when the drive is released. The pushbutton is prevented from rotating by two longitudinal grooves (22) in which two ribs (23) slide.
