Abstract (en)

[origin: WO9923885A1] The present invention is related to the use of histone deacetylase inhibitors as activators of genes responsive to hormone receptors and to counteract the oncogenic functions of oncogenic proteins. Histone deacetylase relieves repressed systems and, when in combination with a ligand for a member of the steroid/thyroid hormone superfamily, the differentiation effects of retinoids are enhanced. Formulations for modulating hormone-mediated processes and assays for the identification of potential modulators are presented.
