Abstract (en)  
[origin: DE19838337A1] The invention relates to a vehicle control system, comprising several components (10 to 1014) that are disposed in different logical planes, at least one coordination component (14) monitoring the performance readiness and the performance requirement of at least one type of resource that is required by at least two consumers, at least one component making available the resource (101, 1011-1013), at least two components (10, 12) consuming the resource, wherein the coordination component and the consuming component are disposed in a logical plane. Said control system is characterized in that the component making available the resource is disposed in a subordinate plane in relation to the consuming component (10, 12) and in that the coordination component (14) interrogates the component making available the resource with regards to its performance capacity concerning the resource.
