Abstract (en)

[origin: WO9929555A1] The invention concerns a folding stroller, comprising two push-arms (8a, 8b) capable of sliding substantially parallel to said stroller underframe bases (3a, 3b) between two extreme positions: an unfolded position, wherein said push-arms (8a, 8b) are unfolded, said stroller unfolding a stroller body (25) for receiving a child; and a folded position, wherein said push-arms (8a, 8b) are at least partially brought alongside said bases (3a, 3b) so as to reduce said stroller space requirement, each of said push-arms (8a, 8b) bearing at least an element (30a, 30b) supporting said stroller body (25) integral with an upper part of said stroller body (25) and mobile in translation relative to said push-arm (8a, 8b), over a predetermined portion thereof. A mobile retaining bow (27) is placed substantially in the plane defined by said push-arms (8a, 8b) in said folded position and is maintained in a substantially horizontal plane, so as to ensure the child's safety, in the unfolded position.
