Abstract (en)

[origin: FR2783957A1] The invention concerns a system for remote activation or control of an automatic or semi-automatic process by taking into account data transmitted by radio communication, the conversion and preservation of said data. Said system enables thereby to activate or deactivate automatic or semiautomatic processes such as immobilising, stopping the operation, preventing any vehicle or equipment from starting or functioning, but also enables to control the timed use over time intervals predetermined or to be transmitted by said data, punctually and cyclically. By extension, said system can also transmit to the users of the vehicle or of the equipment signals or data concerning the condition of the vehicle or equipment and the reasons for triggering the processes or their condition.
