Abstract (en)
[origin: DE19756858A1] A refrigerator has a heat-insulating housing which has an access opening and an inner cladding around a cold chamber. Opposite to this cladding at least on the side walls of the housing lies an outer cladding, spaced away. The outer and inner cladding join together approximately at the same level at the access opening. Heat-insulating devices are provided which position the inner (13) and outer (21) cladding at a certain relative distance at their junction point and hold them together. The devices are designed as positioning noses fixed on the outer cladding, being able to act on both sides upon bead-like molding.
