Abstract (en)

[origin: CA2312868A1] The invention relates to a scale (20) having two force meter devices (21, 22) which independently of each other can be subjected to a weight and a display device (32) for indicating the sum of the weights. The force meter devices (21, 22) are connected to each other in such a way that the one force meter device (21) can rotate in relation to the other force meter device (22). This design allows for the force meter devices (21, 22) to be folded up and thus makes the scale easy to transport. The invention provides for three sensors (34, 35, 36) at the level of the force meter devices (21, 22).
