Abstract (en)  
[origin: WO0024022A1] Disclosed is a coupling device that is located on the actuating member of a switching device (1) such as one as used in a power circuit breaker. The coupling device has a through hole (33) on the actuating member. A coupling element (40) can be inserted into said through hole. When the coupling element (40) is assembled, a first end section (47) thereof protrudes from one end (35) of the through hole (33). A second end section (47) thereof is flush with the opposite end (34) of the through hole (33). In this position, the coupling element (40) forms a recess (25) on one end of the actuating member and the end section (47) of the coupling element (40) protrudes on the other end. Said protruding end section (47) is embodied in such a way that it fits into the recess (25).
