Abstract (en)  
[origin: EP1041201A2] The system incorporates a bed plate (14) and an intermediate layer (30) of elastic material, e.g. polyurethane elastomer, un the sleepers etc. An intermediate plate (32) is positioned between bed plate and elastic layer, to transfer the load from the be plate to the elastic layer. The size of the intermediate plate is mainly independent of load-transferring surfaces of the bed pl facing the intermediate elastic layer. The intermediate plate is of rigid plastic or metal plate. It has a load transfer area of pref. 400cm<sup>2</sup> and/or the metal has a thickness of pref. 2-5mm. A plastic plate has a rigidity of more than 100kN/mm and a thickness of pref. 2-5mm.
