Abstract (en)

[origin: EP1041519A1] The device comprises a cylindrical member arranged with a given inclination relative to the horizontal, facing the inlet for discoidal elements, bringing about point-form contact between the control member and the discoidal piece for the purposes of regularising the reduction of the kinetic energy of an incoming discoidal piece, and also the speed of displacement along the path for the discoidal pieces, which path is determined by an inclined guide arranged as a continuation of the cylindrical control member. <IMAGE>
