Abstract (en)

[origin: WO9932312A1] The invention relates to a device for fastening a lock module comprised of at least one lock part (4), an actuating part (5) and a covering (7) on a module support (1) which is provided for a two-shelled vehicle door and supports the function modules of the vehicle door. To this end, a supporting arm (2) which is elastic in a longitudinal direction and is polydirectionally pliable, thus capable of being readjusted, is fastened to the module support. The supporting arm fixes the lock module in the installation position in an unsupported and resilient manner via a supporting plate (3). The supporting arm is preferably constructed with a tubular shape in order to accommodate a Bowden pull wire (8) for the actuating part of the lock module and/or electric cable.
