Abstract (en)
[origin: DE19757178C1] the locking arrangement has locking plates (17a,17b) for the switch shafts which can engage blocking elements (18a,18b). The locking plate on each switch is connected via a separate flexible connecting element to the blocking element pivotably mounted on the other switch. When one switch is switched on, the rotation of the corresp. locking plate acts via the connecting element to pivot the second blocking element against a locking plate blocking cam surface
