Abstract (en)

[origin: EP1043483A1] The method involves determining the demanded oil pressure values from a characteristic field (40) for an oil pressure regulation loop (2) depending on the operating state; forming a control error signal (1) from the demanded pressure value and the actual value for a selected measurement position and moving an oil delivery control element (13) accordingly. An independent claim is also included for an arrangement for regulating lubrication, preferably for internal combustion engine with a regulated oil pump.
