Abstract (en)

[origin: EP1045070A1] The apparatus is for use when renewing a railway track installation and has a sub-structure (15) and a super-structure. It is particularly with a ballast bedding, with the track (2) laid on the sub-structure and at least one rail movement mechanism (3) on the front of the frame (1) when viewed in the work direction (1). At least one ground movement mechanism (4) is on the rear of the frame and a device (6) for removal of the track from the sub-structure is at the rear of the rail movement mechanism. A device (13) is provided for producing a support layer (14), particularly a hydraulically bound support layer, on the sub-structure, when viewed in the work direction, behind the device for removing the track.
