Abstract (en)

[origin: EP1045214A2] A burner (2) vaporises a refrigerant solution into an condenser (13) containing a heat exchanger feeding a radiator (34) and absorber (6) back to the boiler (1) in a closed circuit. Refrigerant then passes through a throttle valve (12) and an evaporator (11) to provide cooling. The system is controlled by a regulator (17) according to data from an outside thermostat (14), a back flow thermostat (15) a forward flow thermostat (16).
