Abstract (en)

[origin: WO9936922A1] The invention relates to a method for producing an inerting gas (I) to be fed into a container, especially into a nuclear plant (4) containment (2), offering a high degree of reliability and particularly simple design. The support material (T) is chemically bonded to the inerting gas (I) and is made to react with an activating agent (A). A first storage tank (6) in which the support material is maintained (E) and a device (30) for the provision of the activating agent (A) are included in a facility (1,1',1'') which is particularly suitable for implementation of said method. Pressureless storage of the material required to produce the inerting gas (I) is made possible by maintaining the inerting gas in a chemically bonded form.
