Abstract (en)

[origin: DE19846866A1] The invention relates to method and device for reducing the volume of data, especially for image coding (300) and decoding (400) according to the MPEG 4 standard, in a chronological series of data that is to be coded and decoded, whereby said data is divided up into partial data (10, 20), especially image blocks, during coding. Prediction values (250) are produced by means of a quasi-division. Said prediction values (250) are formed from the sum of a first (230) and second approximation (240).
