Abstract (en)

[origin: FR2773431A1] The invention concerns a method for managing a termination system in an integrated-services digital network (7; 20) designed to connect at least two terminals (3, 4) to a line (5) with two transmission channels of said network. The method consists in reserving the two termination system channels for setting up a connection between one of the terminals (3; 4) and a correspondent, and in searching for any request for setting up another connection for the other terminal (4; 3) so that, if such is the case, one of the termination system channels is cleared to be assigned to the other connection.
