Abstract (en)

[origin: EP1046773A1] The invention relates to the structure of a piece of furniture wherein a door (2) comprising a frame formed by sections (8, 9, 10) joined together, is connected to a part (3) of the structure by means of hinges (1) which are secured to one of the sections. Advantageously, the supports (6) of the hinges and the corresponding section (8) are formed in a mutually matching manner so that the former are slidably guided by the latter. Furthermore, the screws for securing the hinges fit into threaded holes passing through the supports (6) so that, when they are tightened, they act against the wall of the section (8) and push the supports (6) towards it, locking them in the desired position. <IMAGE>

[origin: EP1046773A1] The door structure has hinges (1) for applying the door to a wall of a piece of furniture. Each hinge has a support (6) formed in a mutually matching manner so that the former are slidably guided by the latter. Fixing screws fit into threaded holes passing through the respective supports, so that when they are tightened they act against the inner wall of a section and force the supports against it to lock them in the desired position.
