Abstract (en)  
[origin: EP1046784A1] For the cooling of a gas turbine component, subject to high temps., the material of the component (141) has an alternating a of blower openings (22) for a coolant (9) and pins (23) with a high thermal conductivity, of metal or diamond, extending out of component on the cooling side (12). The projecting pins are cooled while heat is applied to the zones where the pins are embedde Through the alternating layout with the blower openings, the air flow (7) is ensured around the pins
