Abstract (en)

1. An electronic power supply circuit provided for supplying electric power to a fluorescent lamp having a first (F1) and a second (F2) filament, said circuit comprising a ballast having a first and a second coil, said first coil being connected between a first power input pole of said circuit and a first distribution line connecting said first coil to a first connection point for said first filament said ballast comprises a second coil having a first coil pole connected to said first distribution line and wherein a series connection of a capacitor and a bi-directional AC switch is connected between a second coil pole of said second coil and a second distribution line connecting a second power input pole of said circuit to a second connection point for said second connection filament. <IMAGE>

A power supply circuit has two filaments (F1,F2). A ballast has two coils (L1,L2), the first connected between one power input pole (A1) and a distribution line (DL1) connecting the coil to the first filament. One coil pole of the second coil is connected to the distribution line. A series connected capacitor and bi-directional AC switch are connected between the second coil pole of the second coil and a second distribution line (DL2) connecting it to the second filament.
