Abstract (en)

[origin: WO9936227A1] Disclosed is a device for dressing a grindstone (1) to polish the running surface structure of a ski. Said device comprises a rotating drive (7) for the grindstone (1), a planing tool (2) with at least one cutting insert that can be placed on the peripheral surface of the grindstone (1) and a feed drive (6) carrying out a relative movement parallel to the axis of the planing tool (2) in relation to the grindstone. In order to provide advantageous manufacturing conditions, the feed drive (6) and/or the rotating drive (7) include a control device (8) with a control program storage (9) that can be selected by means of an input device (10), in addition to an evaluation circuit (12) that is connected to the control program storage (9) to determine the switching points for the speed of the feed device (6) and/or the rotating drive (7), depending on the program selected and the position.
