Abstract (en)
[origin: WO0029305A2] A multicomponent container (1) comprising an outer container (2) for a first component (3) and an inner container (4) for at least a second component (5), whereby the inner container (4) can be opened into the outer container (2) using a rotating device (6), enabling the components (3, 5) to be mixed. The inventive container also comprises a cap (7) that allows the mixed components to be removed. The inner container (4) can be axially rotated using the rotating device (6) and, together with the outer container, forms a non-rotating lock (12). The rotating device (6) engages with an upper end area (10) of the inner container (4), whereby a non-rotating lock (12) is formed by a lower end area (10) of the inner container (4) with a bottom area (11) of the outer container (2). A covering wall (13) with at least one predetermined breaking point is provided in order to open the inner container (4) using the rotating device (6).
