Abstract (en)

[origin: EP1048571A1] A handling apparatus has a device applying a heat shrinkable film to an article on a pallet, a sucking device to draw the bo edge of the film below a palette support and a warm air device to shrink the film. A control mechanism operates two sets of actuators and associated devices supporting the pallet support and the pallet respectively so that the film can be attached to t underside of the pallet without changing the level of the pallet. The actuators and associated devices may be cams and followers. An air extracting fan within a two part telescopic skirt is vertically movable beneath the pallet support.
