Abstract (en)

[origin: EP1048781A2] The cooling system for a papermaking or cardboard prodn. machine has at least one closed primary cooling circuit (3.1-3.4;4.1-4.4) to take off surplus heat. Each primary circuit has at least one primary fluid/water heat exchanger (2.1-2.4) to transfer heat to at least one closed secondary cooling circuit (5,6). The secondary cooling circuit has at least one secondary water/water heat exchanger (8) to transfer heat from the secondary to a tertiary coolant water strand with a coolant water feed and outlet (10) at the papermaking/cardboard prodn. machine. The primary cooling circuit (3.1-3.4;4.1-4.4) uses oil as a heat carrier. The tertiary cooling circuit passes through a cooling tower, where excess heat is released into the ambient environment. The tertiary cooling circuit has a collection vessel where coolant water is fed to the cooling tower and the preparation process if required. The tertiary cooling circuit has an intermediate vessel between the cooling tower and the secondary heat exchanger (8).
