Abstract (en)

[origin: WO9937868A1] A shaped brick (1) for erecting walls, especially dry walls, comprising two opposing visible surfaces (2) and two opposing supporting surfaces (3, 3'). One side of the supporting surfaces (3, 3') defines the base length (L) of the shaped brick. A predetermined breaking point (4) is provided on one half of the base length (L) and on the plane of one of the two supporting surfaces (3, 3'), in addition to two other predetermined breaking points (5, 5') which are respectively provided on both sides of the predetermined breaking point (4) arranged in the centre. The inventive shaped brick is characterised in that the periphery of both supporting surfaces (3, 3') is shaped like a trapezium with a short and a long side defining the base length (L); in that a specific longitudinal ratio exists for the short and long trapezium shaped side and the breadth of the wall (the height of the trapezium) and in that the lateral predetermined breaking points (5, 5') are arranged on end points on (n) partial sections of the base length.
