Abstract (en)
[origin: WO9937873A1] The invention relates to a remote control device for controlling at least one function in access devices having several types of transmitters (1-5) and one type of receiver (10), whereby the receiver (10) cooperates with the access device. Each transmitter has a storage device to store a system identification word and a serial number as well as a coder to code a send signal by means of an algorithm known per se and using a system identification word (SI1-SI5) and a serial number. A different system identification word and a different range of serial numbers are assigned to each type of transmitter (SI2-SI5). The receiver (10) of a given type has a storage device to store the system identification words and the serial number ranges of all types of transmitters as well as a decoder to decode the send signals received using the algorithm. At least one tuning unit is provided in the receiver to tune one or more transmitters and the receiver by transmitting and storing the serial number in the receiver.
