Abstract (en)
[origin: WO9939285A1] A system for creating and manipulating information containers with dynamic registers on a multi-user computer system, or computer network comprises an interactive information container, a container editor, a search interface, a user profile, system-wide hierarchical container gateways (site 7), interactive and evolving container registers, a data collection means, a data reporting means, an analysis engine with editor, an executing engine with editor, and a means of communicating with other computers, computer networks, or digital-based public or published media. The container editor provides an authoring user with the capacity to encapsulate any information component such as a file, set, database, network, event or process, and a set of parameters of multiple container registers to govern the interaction of that container with other containers or processes. The container registers include system-defined, system-alterable, user-defined and user-alterable registers.
