Abstract (en)
[origin: EP1050349A2] A mandrel clamping arrangement is described comprising an actuation mechanism (4) coupled to a clamping assembly (9). The actuation mechanism (4) comprises a linearly actuatable connection rod (8) coupled to a pivotally mounted cam actuator (12) which is angularly displaced by virtue of the linear motion of said connection rod (8). The actuation mechanism is coupled to the clamping assembly by means of interengaging teeth and toothed sprockets (22,24) or by means of a pin (54) disposed at the free end of the actuator which is received in a slot (58) in an eccentric component. In either case, the rotation of the actuator (12) in one direction causes rotation of a cam (28) in the alternate direction, said cam (28) having an arcuate surface through which a clamping force can be exerted on a mandrel (18) beneath said cam (28). Optionally, a clamping bar (30) biased against the cam (28) may also be provided so that the clamping force on the mandrel (18) is exerted by said bar (30). The cam arrangement (28) ensures uniform and precisely applied clamping force over the entire mandrel (18) length and does not require any particularly precisely machined components to achieve this end. <IMAGE>
