Abstract (en)

Coin deflection mechanism for coin reception and collection devices, consisting of a swivelling gate (4) which is driven by its own weight to a closed position, and swivels towards an open position when it receives the weight of a coin (3). The mechanism also includes a lever (6) which is suspended from a rotation shaft (7) and due to its weight tends to occupy an equilibrium position in which it bears on gate (4), locking it in its closed position. Lever (6) is removed from this equilibrium position by activating an electromagnet (9), thus freeing gate (4) so that it may be opened by action of coin (3). <IMAGE>
