Abstract (en)

[origin: WO9939492A1] The invention relates to a method and system for tapping telephone conversations. A useful signal representing the conversation information of a telephone conversation and a data set containing at least one digital network user identification are fed to a recording center (20). The data set is fed to a playback device (28) in which the data set is compared with stored reference data sets. A communication connection to a tapping device (36) is established when the network user identification conforms to a corresponding reference identification of a selected reference data set.
