Abstract (en)

[origin: EP1051929A1] The connecting device comprises a holding angle (3), a swivel lever (4), a rotatable cam (5) and a horizontal recess (6) in side wall of the drawer. The holding angle is fixed on the front plate and its side arm (8) has a vertical slit (10) for the swivel lever allowing the rectangular cam (13) to pass through which in the horizontal position can enter the horizontal recess of the wall whilst in the vertical position it engages in inlet slits (22) of the recess. The rotatable cam (5) has a coaxial neck (16) which can fit into the circular base of the recess of the holding angle, and an eccentric circular section (18) which is mounted with adjustable rotary angle in upper and lower extensions of the base of the recess. The thickness of the side wall and of the arm of the holding angle is set between the walls of the end sections (17, 23) of the rotatable cam.
