Abstract (en)

[origin: EP1052095A1] The arrangement has a fixing device (3) for the printing-start end of the printing plate (1), whereby a U-shaped aperture on this end of the plate is brought into contact with a stop on the plate cylinder. A displacement transducer (8) detects the position of the plate in the fixing device and produces a time reproducing displacement-time signal whose time variation is evaluated in an evaluation unit (10). The position of the front edge of the printing plate is detected within a measurement region of defined size.
