Abstract (en)

[origin: EP1052414A1] Active part (10) of plunger (3) has part (24) of its periphery with smaller radius along angular section, and with sufficient axial length so that, when plunger is moved from resting position, passage is created, between chamber (12) receiving fluid (P) other chamber (13), through gap (26) defined by part and bore (9) once that radial aperture (23) of channel (22) is closed up by wall of bore.
