Abstract (en)

[origin: EP1052471A1] The explosive device consists of a detonator head, an explosive charge (4) of about 90g of hexolite or tolite, a plastic out shell (1), and an inner wall (7) e.g. of copper or aluminum which creates the fragments. The inner wall is in contact with the explosive and is made up of a series of conical, spherical or pyramidal concave sections, each measuring between 2.5 and 5.5 mm across at the base, with a wall thickness of 0.5 - 0.8 mm and an angle of 90 - 140 degrees. The outer plastic shell is sufficient to attenuate the energy released by the explosive charge and sufficiently strong to protect the inner wall during transport.
