Abstract (en)

[origin: WO0032284A1] The device for connecting a snow glider (5) to the boot (4) of a person using a snow glider comprises a device (1) for binding said shoe (4), in addition to intermediate parts (2, 3) that are arranged between the binding device (1) and the snow glider (5) and are secured to the snow glider. These components of the device are embodied as hollow forms. The base body (10) of the binding device (1) and the base body (20; 30) of the respective intermediate part (2,3) comprise a base plate (10; 23) with strip-like limbs (11, 12; 21, 22; 32) protruding therefrom. The limbs (11, 12) of the binding device (1) are associated with the limbs (21, 22; 32) of the intermediate parts (2, 3). The respective limb comprises a series (15; 25; 35) of openings (14, 24, 34). Said series of openings runs practically parallel to the base plate (23). Means (50) that run through the openings of the limbs are provided in order to create a pivoting link between the limbs of the holding device and the limbs of the intermediate parts.
