Abstract (en)
[origin: WO9938414A2] A shelving apparatus is provided having a first set of cross members and a second set of cross members which are adapted to slidably couple with one another to form an adjustable shelf. One set of cross members may have one or more male surfaces while the second set of cross members may have a corresponding number of female surfaces such that the male surfaces of the first set of cross members are slidably received by the female surfaces of the second set of cross members. The cross members, which are formed from light-weight material, may have a cavity therein to assist in making the shelving apparatus strong and light weight. A support bracket is also provided for additional strength for the shelving apparatus.
