Abstract (en)

[origin: EP1053889A2] At least one needle pair is incorporated for forming the two incisions for each thread clamp. For the needle pair a synchronously driven support is provided. The upper conveyor leaves free the needle insert area of the book material(17). Between the needles(of the pair and the support(28) coupled with a parallel crank gear(29) is a holding down device(30), which is tensioned parallel the needles and against the book material such that it comes into engagement with the book material before or at the latest as t same time as the needles.
